- 9 Low Modulus Sealant
- 10 Transition Material Over Wall Assembly
- 11 Wood Blocking
- 12 Transition Material from Back of Wall to Front of Wall
- 13 Parapet Flashing & Counterflashing
- 14 Roof System Waterproof Membrane

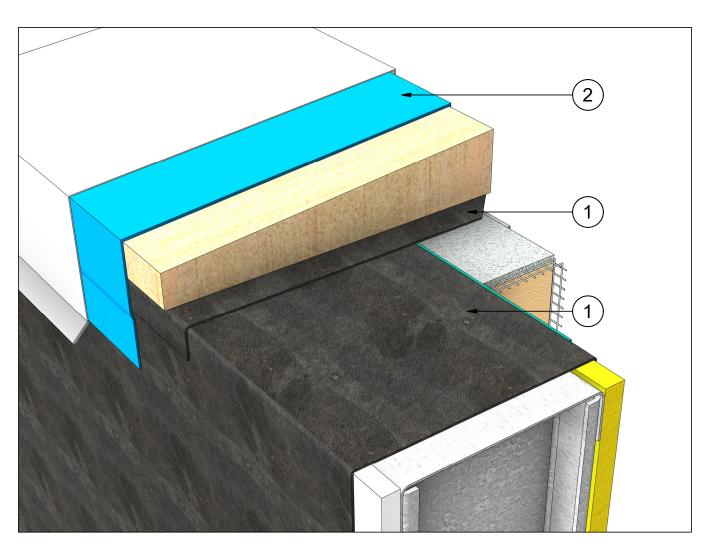

## **DURADOND**.

#### **PARAPET DETAIL**

## **DURADOND**.

#### PARAPET DETAIL

#### **MEMBRANE SPECIFICS**

### (1) Transition Material

There are two **transition membranes** needed to complete the parapet. The first membrane transitions between the backside of the wall and the water resistive barrier.

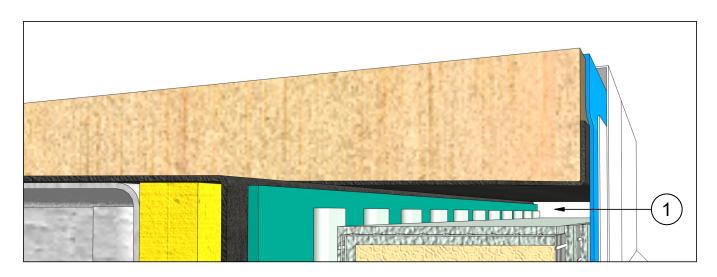

The second membrane then lines the bottom of the wood blocking. It gets overlapped on both sides of the wall by the **air & vapour barrier**. These two layers of transition material ensure that the drainage remains positive at both the front & back of the wall.

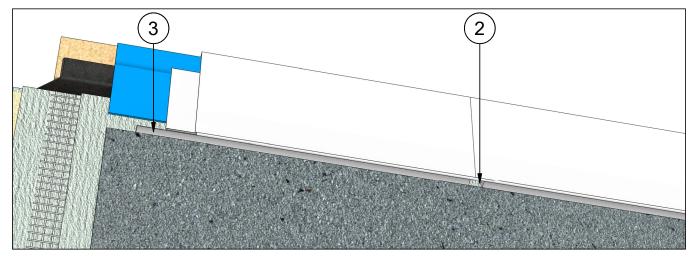

### (2) Roof System Waterproof Membrane

The roof waterproofing membrane, typically an air & vapour barrier, is located directly beneath the metal flashing. It wraps over the enterity of the wall and ensures that the parapet is protected from the elements.

## **DURABOND**.

#### **PARAPET DETAIL**

#### **AIR SPACE & SEALANT SPECIFICS**

1 Provide a 1/2" (13mm) Air Space

The air space at the top of the wall allows for the wall assembly to expand & contract freely without damaging the parapet.

(2) Provide a 1/2" (13mm) Air Space

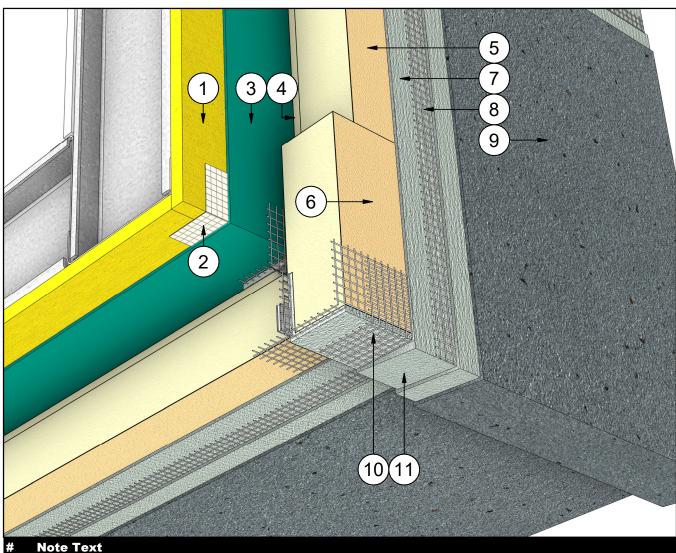

When the parapet has a seam in the metal flashing, the sealant should be broken to allow the system to vent freely.

(3) Sealant Attached to Base Coat

The sealant is attached directly to the base layer. The finish coat is then applied to complete the wall; it abuts against the sealant.
